The goal will be to publish the research in a peer-reviewed journal. 2. exposure to clinical Head and Neck Surgery (clinic and operating room)                                                                                                                                                                                                                                                                                                                            |
| <b>Boyko Atanassov</b><br><br><i>Dept. of Pharmacology and Therapeutics</i><br><br><a href="http://www.roswellpark.org/Boyko-Atanassov">www.roswellpark.org/Boyko-Atanassov</a> | Cancer genetics; Cancer molecular and cellular biology | Scientific Research | <b>Defining the functions of Ubiquitin Specific Proteases in the regulation of Receptor Tyrosine Kinase Signaling Pathways in Cancer</b><br>Abnormal expression of receptor tyrosine kinases (RTKs) has been recognized as a key factor driving tumor progression of several cancers. Work in our laboratory is focused on elucidating the molecular mechanisms by which ubiquitin-specific proteases (USPs) are involved in RTK stabilization in cancer cells and hence potentiate tumor growth.                                                                                                                                                                          |
| <b>Andrei Bakin</b><br><br><i>Dept. of Cancer Genetics</i><br><br><a href="http://www.roswellpark.org/Andrei-Bakin">www.roswellpark.org/Andrei-Bakin</a>                        | Cancer genetics; Cancer molecular and cellular biology | Scientific Research | <b>Tumor-Fibroblast crosstalk In Breast Cancer progression and Tumor Angiogenesis</b><br>Tumor microenvironment facilitates cancer recurrence and metastasis, and can reduce the efficacy of anti-cancer therapy. Tumor-infiltrating immune cells and tumor-associated fibroblasts (TAFs) play important roles in disease progression and treatment. We identified a molecular pathway that regulates tumor vascularization and may contribute to trapping of pro-tumorigenic myeloid cells in tumor stroma. The study will assess the contribution of the specific factors into interaction of the tumor-fibroblast crosstalk in cell culture and xenograft mouse models. |

To accomplish our goals, we are investigating two different, but complementary projects. The first project delineates how mitochondria-mediated cell death signaling is defective in cancer cells and cancer stem cells. The second project defines the role of heat-shock proteins in cancer cell survival and death. We are also characterizing the role of mitochondria in health disparities among prostate and breast cancer patients. Our research suggests that protein complexes are important regulators of cancer cell death and survival. We use multiple biochemical, genetic, cellular, and molecular approaches to identify and characterize protein complexes in subcellular compartments including in the mitochondrion. Detailed understanding of protein complexes will lay a foundation for targeting cell death and survival machinery for cancer therapy. Our model system includes both laboratory cell culture and mouse model of cancer to examine cellular signaling in response to anticancer agents. Our ultimate goal is to target mitochondria and cell death for prevention and therapy of multiple types of cancer.</p> |
| <p><b>Subhamoy Dasgupta</b></p> <p><i>Dept. of Cell Stress Biology</i></p> <p><a href="http://www.roswellpark.org/Subhamoy-Dasgupta">www.roswellpark.org<br/>/Subhamoy-Dasgupta</a></p>       | <p>Cancer genetics;<br/>Cancer molecular and cellular biology;<br/>Cancer pharmacology and therapeutics;<br/>Tumor immunology &amp; immunotherapy</p> | <p><b>Scientific Research</b></p> | <p><b>Metabolic Control of Tumor Progression and Metastasis</b></p> <p>Metabolic reprogramming is an essential hallmark of tumor progression and metastasis. Cancer cells use altered metabolic pathways to sustain rapid growth and to overcome enormous stress encountered in tumor microenvironment. Tumor cells constantly alter their metabolic state in response to oncogenic stimuli, nutrient availability, and interaction with immune cells however the precise regulation that precedes the metabolic alteration is poorly understood. Our lab uses state-of-art facilities such as metabolomics, proteomics, and genomics along with molecular biology techniques to investigate the crosstalk between metabolic signaling and transcriptional networks. Multiple animal model systems including genetically engineered mouse models (GEMMs), patient-derived xenograft (PDX), and syngeneic tumor models are used to investigate metabolic adaptations that tumor progression and metastasis. Projects: (1) Metabolic adaptations driving castration resistant prostate cancer, (2) Oncogenic drivers of bone metastatic prostate cancer, (3) Mechanisms of breast tumor recurrence and metastasis.</p>                                                                                                                                                                               |

The control of the integrity of epigenetic information is equally important and critical for the development and function of multicellular organisms, but far less studied. Epigenetic information is stored as chromatin, the highly organized complex of DNA, histone proteins and their chemical modifications[2]. Accelerated replication and transcription during early embryogenesis and in cancer, resulting in more frequent nucleosome disassembly and enhanced histone turnover, may cause intermixing of histones bearing epigenetic marks and loss of epigenetic information. In cancer, this should lead to the dissolution of original cell identity. However, transcriptome analysis clearly demonstrates that tumors, including cell lines propagated for years in culture, bear easily identifiable traits of tissue of origin in their transcriptional program (TCGA data), which suggests that factors ensuring chromatin stability during early development are activated in cancer to support increased chromatin dynamics. To test this hypothesis, we will optimize methods, used to study of chromatin structure/organization, to measure and compare chromatin stability in normal and tumor cells and to identify factors responsible for the maintenance of epigenetic integrity. These factors may be a source of novel cancer targets. Our data suggest that histone chaperone FACT (Facilitates Chromatin Transcription) is one such factor[3-7]. We will validate FACT as a chromatin stabilizing factor and cancer treatment target. To understand how epigenetic integrity is preserved, we will use novel tools (small molecules and FACT genetic inhibitors) to controllably disassemble chromatin in cells to study consequences and cell response to chromatin destabilization. Our studies will build a foundation for understanding various phenomena, including the stability of the cell differentiation state, low rate of reprogramming and high sensitivity of tumor cells to chromatin desilencing agents.</p> |

| <p><b>Fumito Ito</b></p> <p><i>Dept. of Immunology</i></p> <p><a href="http://www.roswellpark.org/Fumito-Ito">www.roswellpark.org<br/>/Fumito-Ito</a></p> | <p>Tumor immunology &amp; immunotherapy</p> | <p><b>Clinical Research</b></p> | <p><b>Blood-based T-cell Biomarkers for Prediction of Treatment Response and Early Diagnosis of Immune-related Adverse Events to Immune Checkpoint Inhibitors</b></p> <p>Cancer immunotherapies that target the T-cell immune checkpoints, such as CTLA-4, PD-1, and PD-L1 have shown unprecedented success for the treatment of a variety of malignancies. Although a significant number of cancer patients benefit from immune checkpoint inhibitors (CPI), many fail to have clinical responses. Some pretreatment predictors of response to immune checkpoint inhibition have been reported such as PD-L1 expression in tumor cells and the tumor microenvironment (TME), genetic alterations and mutational load in tumor cells, and pre-existing immunity and its enhancement during treatment through tumor-infiltrating immune cells, but there are limitations to tumor site analysis, especially in patients with visceral tumors. Additionally, these therapeutic agents often elicit immune-related adverse events (irAEs) that may result in substantial morbidity. Early intervention can markedly reduce the severity of the irAEs, but biomarkers that allow for their early detection and guide their management are lacking. There is a critical need for blood-based biomarkers to monitor or predict patients' clinical outcome and induction of irAE. Because CPI enhance T-cell responses, we will investigate potential blood-based T-cell biomarkers to predict and monitor treatment response and irAES in patients undergoing treatment with CPI.</p> |

Comprehensive patient databases within the Department of Urology are already constructed for these patient populations and will be used to assist this research. The student will perform patient chart reviews, clinical data collection and simple data analyses to answer key questions about kidney or prostate cancer patient care. Numerous questions are currently under study, and several different options will be available to for the student to choose from. Most research projects are designed to be completed within the 8-week period, but may require longer periods in some cases. Middle authorship on one or multiple manuscript publications will be awarded to the student if his/her assignment is appropriately completed within the 8-week period (or, if necessary, after the 8-week period). For students who perform well during the 8-week rotation, the unique opportunity for future first-author manuscripts will be discussed if the student wishes to continue with the research after the 8-week period. The mentor will meet regularly with the student throughout the 8-week period and provide close one-on-one guidance. No prior clinical research experience is needed. This internship is an ideal opportunity for the highly motivated medical student who is considering a career in either Urology or Medical Oncology.</p> |

Evidence accumulates that fusion-generated gain of PAX3-FOXO1 transcriptional activity aberrantly activates downstream target genes contributing for its oncogenic activity in aRMS. Our recent studies have discovered a functional impact of alteration of Akt signaling pathway in modulating PAX3-FOXO1 function in aRMS malignant behaviors. Akt, a protein serine/threonine kinase presents in three isoforms; Akt1, Akt2 and Akt3 and exhibit differential biological roles in modulating tumor properties associated with growth and progression. We plan to investigate the role of Akt isoforms in controlling PAX3-FOXO1-associated aRMS malignant phenotypes. Our effort on this study will be key to the novel understanding of the complexity Akt isoforms in the regulation of PAX3-FOXO1-associated aRMS malignant behavior, and importantly may provide new insight for the development of therapeutic approaches for this disease.</p> |

Since androgen deprivation therapy (ADT) is the principal treatment for advanced prostate cancer, and when administered for extended periods causes frailty, a major focus is examining the mechanism of ADT-induced muscle loss. We use a broad range of techniques from whole animal imaging to protein biochemistry to gene expression analysis to determine mechanism in order to develop better therapies for prostate diseases.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

We hope to co-opt this ability of microRNAs in order to enhance the immune response to tumor cells. A common means by which tumor cells evade immune cell killing is by signaling to immune cells through so called checkpoint molecules that repress the ability of these immune cells to function. We believe that certain microRNAs have the ability to instruct immune cells to ignore checkpoint molecule signals and therefore kill tumor cells more effectively. A major challenge, however, is to determine which microRNAs possess this ability. Summer interns will participate in screening of many known microRNAs for their ability to limit repressive signals propagated by checkpoint molecules. These studies will expose students to translational research in a basic laboratory setting with a focus on immunology, cell biology and molecular biology.</p> |

| <p><b>Santosh Patnaik</b></p> <p><i>Dept. of <b>Surgical Oncology</b></i></p> <p><a href="http://www.roswellpark.org">www.roswellpark.org</a><br/>/Santosh-Patnaik</p> | <p>Cancer bioinformatics;<br/>Cancer biostatistics;<br/>Cancer genetics;<br/>Cancer molecular epidemiology; Cancer pharmacology and therapeutics; Tumor immunology &amp; immunotherapy;<br/>Surgical Oncology;<br/>Cancer molecular and cellular biology;<br/>Radiation Oncology;<br/>Cancer exper</p> | <p><b>Scientific Research</b></p> | <p><b>Experimental and computational examination of genes in cancer and immunology</b></p> <p>We are interested in genetics (gene mutations, gene expression, etc.) and epigenetics (microRNAs, RNA editing, etc.) as it pertains to cancer and the human body's immunological response to it. This is a very broad area, and allows for a visiting student to contribute their ideas to develop an exciting yet feasible project to carry out during their stay.</p> <p>The project work will involve one or more of the following: (1) Cell biology: cell culture, genetic engineering of cells, etc. (2) Molecular biology: various DNA, RNA, and protein assays, including their development. (3) Animal biology: growing foreign tissue/cells in the mouse, analysis of DNA/RNA/proteins of mouse, etc. (4) Patient biology: various assays of diseased tissues, including association with clinical parameters; (5) Computation: large-scale data analysis, data visualization, bioinformatics, software programming, etc.</p> <p>As a mentor, my goal will be to help the visiting student attain the following: (1) Experience these aspects of scientific research: collate facts from published knowledge and knowledgeable individuals; use facts and imagination to generate hypotheses and exploratory ideas; design, prepare for, and execute experiments; collect, analyze, and present data; set forth a future direction. (2) Learn some common biomedical or computational research techniques. (3) Bring to completion during the student's stay a small but independent project that the student helps with the design, execution, and analysis.</p> |

| <p><b>Mukund Seshadri</b></p> <p><i>Dept. of Oral Medicine/Head and Neck Surgery</i></p> <p><a href="http://www.roswellpark.org/Mukund-Seshadri">www.roswellpark.org/Mukund-Seshadri</a></p> | <p>Cancer biophysics; Cancer pharmacology and therapeutics; Radiation Oncology; Cancer experimental diagnostics; Cancer prevention and epidemiology</p> | <p><b>Scientific Research</b></p>                       | <p><b>Multi-modal Imaging of Cancer</b></p> <p>Research in my laboratory is focused on three main areas: (i) understanding the vascular biology of head and neck cancers and exploiting them for therapeutic benefit, (ii) development of safe and effective bio-adjuvant approaches for the prevention of oral cancers and, (iii) the use of advanced imaging methods such as MRI, CT in preclinical models and in patients to study response of head and neck tumors to chemotherapy and radiation. The work is interdisciplinary in nature and draws on concepts from biophysics, cancer biology, pharmacology and molecular biology. Given my clinical background, I feel strongly about pursuing a research program that addresses clinically-relevant questions in the laboratory setting and potentially translates the knowledge gained into meaningful outcomes for patients.</p>                                                                                                                                                                                                                                                                                    |

We are specifically interested in how interactions between tumor cells and other elements of the host marrow microenvironment contribute to cancer cell survival and therapeutic resistance. Current projects in the lab are focused on optimizing immunotherapy for acute myeloid leukemia and evaluation of antibody drug conjugates targeting CD33 and CD123 expressed on leukemia cells. Students will gain experience in sterile cell culture, proliferation assays, colony formation assays using primary leukemia patient samples, flow cytometry, and bioluminescent mouse models. The goal of our translational laboratory research is to identify immunotherapeutic and biological agents for translation into early stage clinical trials.</p> |

By comparing with the matched normal DNA, we can identify additionally acquired mutations, so called somatic mutations in cancers. Certain somatic mutations may directly contribute to tumorigenesis process by disrupting tumor suppressors or activating oncogenes. Identifying such driver mutations is an important step for understanding the mechanism of cancers and facilitating the development of personalized treatments. The current research will work on the somatic mutations found by NGS in various cancer types. The trainee will be expected to: 1) develop a good understanding of cancer NGS data; 2) by doing literature search and data-mining, identify novel mutations/mechanisms that may contribute to tumor initiation, progression and recurrence; 3) contribute to scientific publications.</p> |
