

Instructions for Patients Who Have Had IL-2 (Interleukin-2) in the Past 6 Months

The IV (intravenous) contrast dye that was used for your exam today contains iodine. If you have been treated with IL-2, or are currently being treated with IL-2, you may have a delayed reaction to this contrast. The contrast material is used for angiograms and CT scans.

You may experience symptoms 1-6 hours after receiving the intravenous contrast.

If you have any of these symptoms, contact your doctor or the Roswell Park Radiology Department as soon as possible.

- Flu-like symptoms: fever, chills, rash, nausea and/or vomiting
- Allergic-reaction symptoms: itching, dizziness, fatigue

The Radiology Department is open from 8:00am to 5:00pm weekdays and can be reached at **716-845-3432**.

When the Radiology Department is closed, calls are answered by our Central Call Center. You may also call Roswell Park 24/7 at **716-845-2300** and the staff will assist you.
