<p>Andrei Bakin <i>Dept. of Cancer Genetics</i> www.roswellpark.org / Andrei-Bakin</p>	<p>Cancer genetics; Cancer molecular and cellular biology; Tumor immunology & immunotherapy</p>	<p>Scientific Research</p>	<p>Tumor-Fibroblast crosstalk In Breast Cancer progression and Tumor Angiogenesis Tumor microenvironment facilitates cancer recurrence and metastasis, and can reduce the efficacy of anti-cancer therapy. Tumor-infiltrating myeloid-derive cells and tumor-associated fibroblasts are major components of breast cancer microenvironment that affect disease progression and treatment. We identified a molecular pathway that controls tumor vascularization and mobilization of pro-tumor myeloid cell populations. The study will explore the treatment strategies and the contribution of the specific factors in the identified pathway using cell culture and preclinical mouse models. Goals: To examine the treatment strategies and to define the contribution of the specific factors in the identified pathway driving the expansion and mobilization of myeloid-derived cell populations. Projects: 1. Test the effect of a pathway inhibitor in mouse models of breast cancer alone and in combination with other therapies. 2. Examine gene expression profiles after genetic inactivation of the pathway in tumor and stromal cells.</p>
<p>Irwin Gelman <i>Dept. of Cancer Genetics</i> www.roswellpark.org / Irwin-Gelman</p>	<p>Cancer genetics; Cancer molecular and cellular biology</p>	<p>Scientific Research</p>	<p>The role of Src in promoting prostate cancer progression The intern will test, using mouse and human prostate cancer cell lines that vary in their PTEN status, how Src controls aggressiveness through the use differential use of PI3K and AKT isoforms . This will involve cell culture, transfection, protein staining, fluorescence microscopy and signaling analysis (e.g.- immunoblots).</p>

Mentor	Research area(s)	Internship category	Internship description
<p>Kent Nastiuk</p> <p><i>Dept. of Cancer Genetics and Genomics, Urology</i></p> <p>www.roswellpark.org / Kent-Nastiuk</p>	<p>Cancer experimental diagnostics;Cancer genetics;Cancer molecular and cellular biology;Cancer pharmacology and therapeutics;Urology</p>	<p>Scientific Research</p>	<p>Muscle loss with androgen deprivation therapy for prostate cancer, or imaging of prostate cancer</p> <p>My lab is investigating how androgen regulated growth and apoptosis signaling pathways are changed in prostate cells in culture, in mouse models and in patient samples of prostate disease (BPH, inflammation, cancer). Since androgen deprivation therapy (ADT) is the principal treatment for advanced prostate cancer, and when administered for extended periods causes frailty, a major focus is examining the mechanism of ADT-induced muscle loss. We are also working to develop targeted molecular agents for both MR and photoacoustic imaging of prostate cancer (with Hans Schmitthenner, RIT). We use a broad range of techniques from whole animal imaging to protein biochemistry to gene expression analysis to determine mechanism in order to develop better therapies for prostate diseases.</p>
<p>Joyce Ohm, PhD</p> <p><i>Dept. of Cancer Genetics</i></p> <p>www.roswellpark.org /Joyce-Ohm</p>	<p>Cancer genetics</p> <p>Cancer molecular and cellular biology</p>	<p>Scientific Research</p>	<p>Epigenetic remodeling in translocation associated soft tissue sarcomas</p> <p>My laboratory is actively investigating how both genetic and environmental determinants may reprogram the epigenome and contribute to tumor initiation and progression. I currently have an NIH RO1 grant focused on epigenomic remodeling in stem cells and differentiated neural cells following exposures to environmental toxicant exposure as well as an ongoing program looking at epigenetic reprogramming in translocation associated soft-tissue sarcomas. My research lab regularly performs -omics level molecular analysis of normal, pre-malignant, and malignant cell populations including RNA-sequencing, ChIP-sequencing, and global methylation analysis, all of which are key elements of my ongoing research. Our long term goals are to identify novel therapeutic strategies for the treatment of aggressive human cancers based on their molecular profiling.</p>

Mentor	Research area(s)	Internship category	Internship description
<p>Maciej Goniewicz <i>Dept. of Cancer Prevention and Population Sciences</i> www.roswellpark.org / Maciej-Goniewicz</p>	<p>Cancer prevention and epidemiology;Public Health</p>	<p>Scientific Research</p>	<p>Safety of electronic cigarettes Research projects are focused on new nicotine-containing products and alternative forms of tobacco. We examine safety and efficacy of electronic nicotine delivery devices, commonly called e-cigarettes. These studies include the laboratory evaluation of the products, pharmacological and toxicological assessment, surveys among their users, and their potential application in harm reduction, cancer prevention and smoking cessation.</p>
<p>Richard O'Connor <i>Dept. of Cancer Prevention and Population Sciences</i> www.roswellpark.org / Richard-O'Connor</p>	<p>Cancer prevention and epidemiology;Regulatory Science</p>	<p>Scientific Research</p>	<p>Consumer responses to flavored tobacco products Students will have the opportunity to participate in exciting ongoing research in tobacco regulatory science as a part of our Western New York Center for Research on Flavored Tobacco Products, one of 9 Tobacco Centers of Regulatory Science in the US. Interns will assist with data processing from several studies examining consumer's cognitive and sensory responses to flavored electronic cigarettes. Activities would include secondary analysis of existing datasets, observing data collection from ongoing studies, and helping to prepare materials for upcoming research studies.</p>

Mentor	Research area(s)	Internship category	Internship description
<p>Li Tang <i>Dept. of Cancer Prevention and Population Sciences</i> www.roswellpark.org / Li-Tang</p>	<p>Cancer molecular epidemiology; Cancer prevention and epidemiology</p>	<p>Scientific Research</p>	<p>Gene-diet interactions in cancer survivorship and treatment outcome Our research program is engaged in molecular epidemiological study of cancer, with focus on cancer recurrence and survival. Our research interest is to understand the interactive roles of genetic and dietary factors in cancer prognosis by utilizing multi-disciplinary approaches. The primary focus is on cruciferous vegetables and their key anti-cancer effectors, the phytochemical isothiocyanates. We have successfully conducted studies on anti-cancer mechanisms, metabolism, and bioavailability of isothiocyanates in both in vitro and in vivo models. We are currently investigating ways to translate findings into clinical settings, in the hope of developing dietary intervention approaches to improve cancer prognosis.</p>
<p>Binnian Wei <i>Dept. of Cancer Prevention and Population Sciences</i> www.roswellpark.org / Binnian-Wei</p>	<p>marijuana and tobacco specific - biomarker measurement; Cancer prevention and epidemiology; Cancer molecular epidemiology; Pediatrics</p>	<p>Scientific Research</p>	<p>Developing and Optimizing Automated Sample Preparation Methods for Measuring Tobacco- and Marijuana-Specific Biomarkers in Human Samples Qualified candidates will work with the scientists in our lab to develop and optimize high throughput automated methods that use cutting-edge liquid-handling workstation for quantifying tobacco and marijuana specific biomarkers, i.e. nicotine, cannabinoids and their metabolites in human samples.</p>

Mentor	Research area(s)	Internship category	Internship description
<p>Subhamoy Dasgupta</p> <p><i>Dept. of Cell Stress Biology</i></p> <p>www.roswellpark.org / Subhamoy-Dasgupta</p>	<p>Cancer genetics; Cancer molecular and cellular biology; Cancer pharmacology and therapeutics; Tumor immunology & immunotherapy</p>	<p>Scientific Research</p>	<p>Metabolic Control of Tumor Progression and Metastasis</p> <p>Metabolic reprogramming is an essential hallmark of tumor progression and metastasis. Cancer cells use altered metabolic pathways to sustain rapid growth and to overcome enormous stress encountered in tumor microenvironment. Tumor cells constantly alter their metabolic state in response to oncogenic stimuli, nutrient availability, and interaction with immune cells however the precise regulation that precedes the metabolic alteration is poorly understood. Our lab uses state-of-art facilities such as metabolomics, proteomics, and genomics along with molecular biology techniques to investigate the crosstalk between metabolic signaling and transcriptional networks. Multiple animal model systems including genetically engineered mouse models (GEMMs), patient-derived xenograft (PDX), and syngeneic tumor models are used to investigate metabolic adaptations that tumor progression and metastasis. Projects: (1) Metabolic adaptations driving castration resistant prostate cancer, (2) Oncogenic drivers of bone metastatic prostate cancer, (3) Mechanisms of breast tumor recurrence and metastasis.</p>

Mentor	Research area(s)	Internship category	Internship description
<p>Asoke Mal</p> <p><i>Dept. of Cell Stress Biology</i></p> <p>www.roswellpark.org / Asoke-Mal</p>	<p>Cancer genetics; Cancer molecular and cellular biology; Cancer pharmacology and therapeutics; Pediatrics</p>	<p>Scientific Research</p>	<p>Molecular mechanisms driving translocation-associated soft tissue cancer rhabdomyosarcoma</p> <p>Soft tissue tumor such as rhabdomyosarcoma (RMS) is a highly malignant and the most commonly diagnosed cancer in children and adolescents. Current therapies have improved overall survival of RMS patients, yet remain lower than that for many other pediatric cancers. RMS falls into one of two biologically distinct subgroups: embryonal RMS (eRMS) or the aggressive alveolar RMS (aRMS), however their treatment regimens have been very similar. While current therapeutic strategies have improved the overall survival in patients with eRMS (>80%), the efficacy in aRMS remains dismal (<50%).</p> <p>Molecularly, aRMS is defined as a specific chromosomal translocation associated fusion carrying tumor e.g. fusion PAX3-FOXO1 transcription factor and patients with fusion-positive tumors exhibit the worst prognosis (<10% overall survival). In addition, studies both from genetic and functional point of view highlight that PAX3-FOXO1 acts as a driver oncogene in aRMS tumorigenesis and tumor cells depend on continuous activity of this fusion oncoprotein. While these facts underscore that PAX3-FOXO1 is the most suitable therapeutic target for aRMS, so far, any PAX3-FOXO1 directed therapeutic strategies have not been explored. Therefore, functional studies at different molecular angles are necessary to identify tumor specific vulnerabilities that may open the door to eradicate biological behaviors of PAX3-FOXO1-positive tumor with the goal for its potential as the most effective therapeutic strategy.</p> <p>Since aRMS-specific PAX3-FOXO1 bearing tumor is a transcription-driven disease, our research study involves epigenetic mechanisms and signaling pathways in regulating aRMS and discovering potential therapeutic targets and strategies.</p> <p>Our approaches to identify tumor specific aberrations such as epigenetic mechanisms and signaling pathways, and to identify drug-like compounds by functional screening of small molecules chemical libraries will likely provide opportunities for novel therapeutic interventions in patients with fusion-positive aRMS tumors</p>

<p>Gal Shafirstein <i>Dept. of Cell Stress Biology</i> www.roswellpark.org / Gal-Shafirstein</p>	<p>Photodynamic Therapy</p>	<p>Scientific Research</p>	<p>Treatment Planning and Light Dosimetry in Photodynamic Therapy (PDT) My research team is focused on the development and implementation of treatment planning and light dosimetry in PDT. My group includes, 2 engineers, 2 research scholars and 3 pre-doctoral student. We do preclinical and clinical studies, and investigate combination therapies.</p>
<p>Joseph Spernyak <i>Dept. of Cell Stress Biology</i> www.roswellpark.org / Joseph-Spernyak</p>	<p>Cancer biophysics</p>	<p>Scientific Research</p>	<p>Development of Novel MR Imaging Agents Dr. Spernyak, in collaboration with Dr. Janet Morrow (UB Chemistry), is developing novel MR imaging agents with improved safety profiles and that allow for probing tumor microenvironments. An internship in his lab will expose students to a range of scientific disciplines, including chemistry, physics, image processing and computer programming. Course completion in one or more of these fields is recommended but not necessary.</p>
<p>Mollie Hutton <i>Dept. of Clinical Genetics</i> www.roswellpark.org / Mollie-Hutton</p>	<p>Clinical genetics</p>	<p>Clinical Research</p>	<p>Exploring issues related to genetic counseling/testing for hereditary cancer risk This internship is directed toward students specifically planning to pursue a graduate degree in genetic counseling. Students will complete clinical observations (a requirement when applying to graduate programs in genetic counseling) as well as gain valuable clinical research experience. Past projects have included data review of past Clinical Genetics Service patients to demonstrate the importance of periodic follow up and patient decision making when pursuing testing through a multi-gene panel. Additional opportunities include construction of genetic pedigrees through the Progeny program and composing patient literature.</p>
<p>Joseph Barbi <i>Dept. of Immunology</i> www.roswellpark.org / Joseph-Barbi</p>	<p>Tumor immunology & immunotherapy</p>	<p>Scientific Research</p>	<p>Exploring the mechanisms and therapeutic potential of novel factors capable of modulating immune responses. The immune system's destructive potential is regulated by numerous regulatory mechanisms. By understanding these we can devise novel therapies to unleash optimal anti-tumor responses in cancer patients. These studies will utilize in vitro assays of immune cell function, in vivo (mouse) tumor models, and fluorescence-based techniques for visualizing immune cells.</p>

Mentor	Research area(s)	Internship category	Internship description
<p>Scott Olejniczak <i>Dept. of Immunology</i> www.roswellpark.org / Scott-Olejniczak</p>	<p>Cancer molecular and cellular biology; Tumor immunology & immunotherapy</p>	<p>Scientific Research</p>	<p>Harnessing the power of microRNAs to improve tumor immunotherapy MicroRNAs are small non-coding RNAs that function to repress expression of target genes and thereby possess the ability to fundamentally alter how cells behave. We hope to co-opt this ability of microRNAs in order to enhance the immune response to tumor cells. A common means by which tumor cells evade immune cell killing is by signaling to immune cells through so called checkpoint molecules that repress the ability of these immune cells to function. We believe that certain microRNAs have the ability to instruct immune cells to ignore checkpoint molecule signals and therefore kill tumor cells more effectively. A major challenge, however, is to determine which microRNAs possess this ability. Summer interns will participate in screening of many known microRNAs for their ability to limit repressive signals propagated by checkpoint molecules. These studies will expose students to translational research in a basic laboratory setting with a focus on immunology, cell biology and molecular biology.</p>
<p>Joseph Skitzki <i>Dept. of Immunology</i> www.roswellpark.org / Joseph-Skitzki</p>	<p>Tumor immunology & immunotherapy; Surgical Oncology</p>	<p>Scientific Research Clinical Research</p>	<p>real-time monitoring of anti-cancer immune responses My laboratory focuses on the understanding of how lymphocytes trafficking to sites of tumor during immunotherapy. Recent advances in intravital microscopy are being leveraged for clinical translation. Specific projects in the lab are: 1. To evaluate reagents for human lymphocyte labeling 2. To determine if endogenous lymphocyte activity can be followed over time in mouse models 3. To develop analytical methods for intravital microscopy</p> <p>observership in surgical oncology I am a surgical oncologist in the area of soft tissue surgery. My focus is on melanoma and regional therapies for cancer. There are opportunities for an interested student to observe our clinic and OR practice. A melanoma clinical database exists along with corresponding tissue and blood samples which could be a source for a short-term project. The end-goal would be to generate a clinical hypothesis, extract the data and have it presented in a scientific manner (abstract, manuscript, poster)</p>

Mentor	Research area(s)	Internship category	Internship description
<p>John Ebos <i>Dept. of Medicine</i> www.roswellpark.org / John-Ebos</p>	<p>Cancer molecular and cellular biology; Cancer pharmacology and therapeutics; Tumor immunology & immunotherapy; Surgical Oncology; Cancer genetics</p>	<p>Scientific Research</p>	<p>Resistance and metastasis following tumor microenvironment inhibition Student will use clinically relevant models of spontaneous metastatic disease to study resistance to antiangiogenic (VEGF pathway) and immunecheckpoint (PD-1 pathway) inhibitors.</p>
<p>Anm Nazmul Khan <i>Dept. of Medicine</i> www.roswellpark.org / Anm Nazmul-Khan</p>	<p>Tumor immunology & immunotherapy</p>	<p>Scientific Research</p>	<p>Evaluate how neutrophils mediate T cell suppression in ovarian cancer microenvironment Cellular necrosis is associated with release of damage-associated molecular patterns (DAMPs) that activate innate immune responses. It has been shown that circulating DAMPs, specifically mitochondrial DNA (mtDNA), released following traumatic injury activate innate immune cells such as neutrophils, and elicit neutrophil-mediated inflammation. Our lab found that advanced epithelial ovarian cancer (EOC) is associated with accumulation of neutrophils and other myeloid cells in the local tumor environment. We also observed that mtDNA accumulate in the cell-free ascites of patients with advanced EOC; however, their role in shaping innate immune responses and ovarian tumor growth is unknown. Furthermore, we have also shown that cell-free ascites from EOC patients converts normal peripheral blood neutrophil to an immunosuppressive phenotype which inhibits activated T cell proliferation. However how cell-free ascites modulate neutrophil to become immunosuppressive in EOC microenvironment is unknown. The goal of this project is to evaluate the mechanisms involved in neutrophil mediated T cell suppression in ovarian tumor microenvironment. To achieve this aim in vitro cellular assay and flowcytometry will be used involving human peripheral blood cells and ascites from EOC patients.</p>
<p>Brahm Segal <i>Dept. of Medicine</i> www.roswellpark.org / Brahm-Segal</p>	<p>Tumor immunology & immunotherapy</p>	<p>Scientific Research</p>	<p>Innate Immune Responses in Ovarian Cancer The intern will work under the supervision of a senior scientist or PhD student to evaluate immune responses in patients with ovarian cancer. Work may also involve mouse models of ovarian cancer.</p>

Mentor	Research area(s)	Internship category	Internship description
<p>Eunice Wang <i>Dept. of Medicine</i> www.roswellpark.org / Eunice-Wang</p>	<p>Cancer pharmacology and therapeutics; Medical Oncology; Cancer molecular and cellular biology; Tumor immunology & immunotherapy</p>	<p>Scientific Research</p>	<p>Novel Biological Therapies for Acute Leukemia Our laboratory research focuses on the preclinical assessment and development of novel therapeutic strategies for acute leukemia. We are specifically interested in how interactions between tumor cells and other elements of the host marrow microenvironment contribute to leukemia cell survival and therapeutic resistance. Current projects in the lab are focused on optimizing immunotherapy for acute myeloid leukemia, evaluation of novel antibody drug conjugates targeting CD33 and CD123 expressed on leukemia cells, and the role of autophagy inhibitors in overcoming therapy resistance. Students will gain experience in sterile cell culture, proliferation assays, colony formation assays using primary leukemia patient samples, flow cytometry, and bioluminescent mouse models. The goal of our translational laboratory research is to agents amenable to rapid translation into early stage clinical trials at our institute.</p>
<p>Michael Higgins <i>Dept. of Molecular and Cellular Biology</i> www.roswellpark.org / Michael-Higgins</p>	<p>Epigenetics and Cancer</p>	<p>Scientific Research</p>	<p>Epigenetic Affects of Reproductive Factors We are interested in whether the number of pregnancies and/or the breast feeding may affect the methylation of key developmental genes in the human breast and mouse mammary gland. Methylation at one or more of these genes may impact the prevalence of more aggressive estrogen receptor negative (ER-) breast cancer. This study will involve isolation of murine mammary gland epithelial cells, their analysis by flow cytometry, as well as methylation analysis and gene expression analysis of both mouse and human mammary gland cells.</p>

Mentor	Research area(s)	Internship category	Internship description
<p>Steven Pruitt <i>Dept. of Molecular and Cellular Biology</i> www.roswellpark.org / Steven-Pruitt</p>	<p>Cancer bioinformatics; Cancer genetics; Cancer molecular and cellular biology</p>	<p>Scientific Research</p>	<p>Stem/progenitor cell replication in cancer and aging Work under this internship will be directed at understanding how normal and abnormal DNA replication and cell proliferation of stem and progenitor cells contribute to tissue maintenance and genome stability in cancers and during aging. Depending on the specific project, the work may include molecular cloning, molecular biological techniques (e.g. gel electrophoresis, western blot analyses, PCR), cell culture (including transduction/transfection and FACS), generation of and/or histological/molecular characterization of transgenic mice, and whole genome bioinformatic analyses.</p>
<p>Mukund Seshadri <i>Dept. of Oral Medicine/Head and Neck Surgery</i> www.roswellpark.org / Mukund-Seshadri</p>	<p>Cancer biophysics; Cancer pharmacology and therapeutics; Radiation Oncology; Cancer experimental diagnostics; Cancer prevention and epidemiology</p>	<p>Scientific Research Clinical Research</p>	<p>Multi-modal Imaging of Cancer Research in my laboratory is focused on three main areas: (i) understanding the vascular biology of head and neck cancers and exploiting them for therapeutic benefit, (ii) development of safe and effective bio-adjuvant approaches for the prevention of oral cancers and, (iii) the use of advanced imaging methods such as MRI, CT in preclinical models and in patients to study response of head and neck tumors to chemotherapy and radiation. The work is interdisciplinary in nature and draws on concepts from biophysics, cancer biology, pharmacology and molecular biology. Given my clinical background, I feel strongly about pursuing a research program that addresses clinically-relevant questions in the laboratory setting and potentially translates the knowledge gained into meaningful outcomes for patients.</p>
<p>Boyko Atanassov <i>Dept. of Pharmacology and Therapeutics</i> www.roswellpark.org / Boyko-Atanassov</p>	<p>Cancer genetics; Cancer molecular and cellular biology</p>	<p>Scientific Research</p>	<p>Defining the functions of Ubiquitin Specific Proteases in the regulation of Receptor Tyrosine Kinase Signaling Pathways in Cancer Abnormal expression of receptor tyrosine kinases (RTKs) has been recognized as a key factor driving tumor progression of several cancers. Work in our laboratory is focused on elucidating the molecular mechanisms by which ubiquitin-specific proteases (USPs) are involved in RTK stabilization in cancer cells and hence potentiate tumor growth.</p>

Mentor	Research area(s)	Internship category	Internship description
<p>Dhyan Chandra</p> <p><i>Dept. of Pharmacology and Therapeutics</i></p> <p>www.roswellpark.org / Dhyan-Chandra</p>	<p>Cancer molecular and cellular biology; Cancer pharmacology and therapeutics</p>	<p>Scientific Research</p>	<p>Mitochondrial Regulation of Cell Death and Resistance in Cancer</p> <p>The main focus of our research is to understand the molecular basis of therapy resistance in multiple cancer types including in prostate, breast, and colon cancers. To accomplish our goals, we are investigating two different, but complementary projects. The first project delineates how mitochondria-mediated cell death signaling is defective in cancer cells and cancer stem cells. The second project defines the role of heat-shock proteins in cancer cell survival and death. We are also characterizing the role of mitochondria in health disparities among prostate and breast cancer patients. Our research suggests that protein complexes are important regulators of cancer cell death and survival. We use multiple biochemical, genetic, cellular, mouse models of cancer, and molecular approaches to identify and characterize protein complexes in subcellular compartments including in the mitochondrion. Detailed understanding of protein complexes will lay a foundation for targeting cell death and survival machinery for cancer therapy. Our model systems include both laboratory cell culture and mouse models of cancer to examine cellular signaling in response to anticancer agents. Our ultimate goals are to understand mitochondrial biology in cancer and target mitochondria for prevention and therapy of multiple types of cancer.</p>
<p>Gokul Das</p> <p><i>Dept. of Pharmacology and Therapeutics</i></p> <p>www.roswellpark.org / Gokul-Das</p>	<p>Cancer genetics; Cancer molecular and cellular biology; Cancer pharmacology and therapeutics</p>	<p>Scientific Research</p>	<p>Mechanisms by which Hormone Receptors and Tumor Suppressors Impact Cancer</p> <p>The research in Das lab focuses on understanding the cellular and molecular mechanisms of cancer, especially breast, lung, and ovarian cancers. For example, we are analyzing the role of hormone receptors (such as the estrogen receptor) and tumor suppressors (such as the p53 protein) in cancer onset and progression using cell culture and mouse genetic models. Summer projects will involve modern cellular and molecular biological techniques.</p>

<p>Khurshid Guru <i>Dept. of Urology</i> www.roswellpark.org / Khurshid-Guru</p>	<p>Urology;Medical Oncology;Surgical Oncology;Surgical training, human factors engineering, etc.</p>	<p>Scientific Research Clinical Research</p>	<p>ATLAS Internship Specialties: 1) Medicine 2) Engineering 3) Medical Illustration 4) Data Managing Past Intern Accomplishments: 1. Published as co-authors of manuscripts, posters, and presentations in prestigious journals and conferences such as the Journal of Urology, BJUI, IJU, AUA, ERUS, EAU, etc. 2. Develop medical technologies and apply and achieve patents for their inventions 3. Invited to attended and present projects at national conferences 4. Develop patient education tools (Android application) 5. Become a co-consenter in clinical trials where they are able to interact with patients in RPCI clinic 6. Become wet-lab certified to bed-side assist in robotic surgery labs 7. Log hours of OR observation and video classification of real cases 8. Complete the Introduction to Robotic Surgery and Introduction to Laparoscopic Surgery Curriculum (Certification) 9. Learn how to navigate patient records on multiple web-based platforms 10. Learn how to maintain, develop, and manipulate databases for research purposes</p> <p>ATLAS Internship Specialties: 1) Medicine 2) Engineering 3) Medical Illustration 4) Data Managing Past Intern Accomplishments: 1. <p>Eric Kauffman <i>Dept. of Urology</i> www.roswellpark.org / Eric-Kauffman</p>	<p>Cancer genetics;Cancer molecular and cellular biology;Cancer pharmacology and therapeutics;Urology; Medical Oncology;Surgical Oncology;Other (please specify);Radiology</p>	<p>Scientific Research Clinical Research</p>	<p>Molecular and cellular research in kidney cancer and prostate cancer Work in my lab is focused on kidney cancer primarily, and prostate cancer secondarily. There are two main projects undergoing. The first project investigates the role of iron metabolism and resulting oxidative stress levels in the development and progression of kidney tumors. Iron metal is among the greatest sources of oxidative stress in cells of the human body, but also provides the sole “ingredient” needed to transform precursor tissue into kidney tissue during embryo organogenesis. We hypothesize that iron is therefore important in the development of kidney tumors and their progression. In mice, administration of high levels of iron leads to mouse kidney tumors which morphologically mimic human kidney cancer. On the other hand, too high iron levels are detrimental to kidney cancers. Drug treatments targeting iron/oxidative stress metabolism will be tested in vitro and mice to determine whether kidney cancer growth can be blocked. The second project investigates “circulating” cancer cells in the bloodstream of patients with kidney or prostate tumors. These cells exist at extremely low concentrations in the bloodstream and are challenging to identify. This project is exploring cell imaging based on flow cytometry principles to characterize protein expression in these circulating cancer cells to better guide treatment decisions of kidney and prostate cancer patients.</p> <p>Clinical research in kidney cancer and prostate cancer patientsThis internship involves clinical data abstraction and analysis for patients diagnosed with kidney or prostate cancer at Roswell Park who have been treated with surgery or managed non-operatively with active surveillance. Comprehensive patient databases within the Department of Urology are already constructed for these patient populations and will be used to assist this research. The student will perform patient chart reviews, clinical data collection and simple data analyses to answer key questions about kidney or prostate cancer patient care. Numerous questions are currently under study, and several different options will be available to for the student to choose from. Several projects have considerable overlap with RadiologyThe mentor will meet regularly with the student throughout the 8-week period and provide close one-on-one guidance. This internship is an ideal opportunity for the medical student who is considering a career in Urologic Oncology, Medical Oncology and Radiology.</p>

<p>Yue Wu <i>Dept. of Urology</i> www.roswellpark.org / Yue-Wu</p>	<p>Cancer molecular and cellular biology; Cancer molecular epidemiology; Cancer pharmacology and therapeutics; Cancer prevention and epidemiology; Cancer bioinformatics; Cancer genetics; Urology; Medical Oncology</p>	<p>Scientific Research</p>	<p>Understanding Progression of Prostate Cancer to Castration Re-Current Disease My research interest is in microenvironment of cancer - how cancer cells, endothelial cells and stromal cells interact with each other, and how the interactions affect cancer cell growth. Prostate cancer models are used primarily in my lab. The ultimate goal is to delineate mechanisms that drive progression of androgen-stimulated prostate cancer to castration-resistant prostate cancer, and to identify novel modalities to prevent or treat castration-resistant prostate cancer.</p>
