Early detection is changing the face of lung cancer, reducing mortality by diagnosing the majority of cancers at early — and highly treatable — stages.

Of the cancers detected through our screening program, **70% are early stage cancers**.

Our **Lung Cancer Screening Program** involves a focused medical history, physical examination and a non-contrast helical Low Dose CT (LDCT).

**Who should be screened for lung cancer?**

- Patients with a **history of cancer** of the lung, esophagus, head or neck, or
- Patients with the following **three factors**:
  - aged 55 to 79
  - at least 30 pack/years of smoking
  - actively smoked within the last 15 years

Focusing screening on the higher risk patients will improve cancer detection rates and decrease false positives with a multidisciplinary team to manage significant nodules.
Our Treatment Capabilities

In the event a malignancy is detected, your patient will have immediate access to multidisciplinary treatment planning encompassing the latest therapeutic approaches, including:

- **Minimally invasive thoracoscopic surgery.**
  We are a high-volume center — more than 90% of lobectomies are performed with video-assisted thoracoscopic surgery (VATS).

- **On-site tumor molecular profiling** to personalize treatment to the cancer’s genetic characteristics through OmniSeq Comprehensive™.

- **Stereotactic Body Radiation Therapy (SBRT)** to deliver high-dose radiotherapy in fewer sessions.

- **Robust clinical trials program** offering the latest advances in immunotherapy, targeted therapy and novel agents.

Let Roswell Park Manage Your Patients with Lung Nodules

Our multidisciplinary team — including experts in interventional pulmonology, diagnostic radiology, pulmonary pathology, nuclear medicine, smoking cessation and medical, surgical and radiation oncology — manages the surveillance to detect malignancies at the earliest stages, while avoiding unnecessary invasive intervention. We offer:

- **Low Dose CT** scans, according to NCCN guidelines as indicated by nodule characteristics

- **PET/CT**

- **Minimally invasive biopsy** (sampling techniques include bronchoalveolar lavage, brushings and biopsy)

- **Diagnostic bronchoscopy** (endobronchial ultrasound and robotic navigational bronchoscopy)

- **Therapeutic bronchoscopy** (rigid bronchoscopy, airway thermal treatment and airway stenting)

- **Video-assisted thoracoscopic surgery (VATS)**

Robotic Bronchoscopy Now Available

A new technology — the Monarch™ Platform Robotic Bronchoscopy — is a game-changer for detection and biopsy of very small, peripheral lung nodules without surgery. As lung cancer screening increases, the nodules detected are smaller and more difficult to reach. With robotic bronchoscopy, we can safely biopsy remote nodules minimally invasively. Roswell Park is the first and only center in New York State to have the Monarch robotic bronchoscopy.
Highest Risk Characteristics to Consider

- 50+ Pack Years exposure to cigarettes
- Current Smokers
- Smoked 1 ½ packs of cigarettes per day
- Former smokers quit <10 years
- Moderate-severe COPD (FEV1 < 70%)
- Positive family history of lung cancer
- Low BMI
- History of pneumonia

When time and resources are limited, screening should be focused on the highest-risk patients, which will lead to more cancers detected and fewer false positives. Shifting diagnosis to earlier stages equates to more treatment options and better survival.”

—Mary Reid, MSPH, PhD
Director of Cancer Screening and Survivorship

Clinical information should be combined with Lung-Rads score to determine an appropriate follow-up schedule

Refer to the Roswell Park Lung Nodule Clinic

- Lung-Rads Score of 3 or more.
- Any growing Nodule
- New nodule at follow-up CTs that is not a suspected infection
- Solid Nodules of >8 mm- 1.4 cm
- Semi-Solid Nodules > 1 cm or solid component > 5 mm
- GGO Lesions > 2 cm
