

# The High Risk Ovarian Cancer Clinic

at Roswell Park Cancer Institute

Ovarian cancer is difficult to detect in its early stages. Routine pelvic exams detect only 1 in 10,000 ovarian cancers in asymptomatic patients. Roswell Park's **High Risk Ovarian Cancer Clinic** helps women who are at increased risk be proactive in catching the disease before it progresses.

High-risk patients will receive: a comprehensive ovarian cancer risk assessment and genetic counseling; risk reduction strategies and access to clinical research studies; and regular screenings with the most advanced diagnostics available.

## You may be at above-average risk of developing ovarian cancer if you have:

- A personal history of breast cancer before the age of 45
- A male relative with breast cancer
- A personal or family history of ovarian, fallopian tube, or primary peritoneal cancer in a first- or second-degree relative (mother, sister, grandmother)
- A personal or family history of hereditary non-polyposis colorectal cancer (Lynch II) in a first- or second-degree relative
- A personal or family history of a BRCA mutation

If you wish to schedule an appointment or consultation at the High Risk Ovarian Cancer Clinic, call **1-877-ASK-RPCI (1-877-275-7724)** to speak to a cancer information specialist.
